

COLLAPSIBLE INFANT SWING

Abstract

The present invention provides an infant swing frame having a base, and first and second support posts. Each of the support posts is pivotally coupled at a first end thereof to the base, and each of the support posts has a second end. A cross member is coupled between the support posts. The support posts and the base are reconfigurable between a first position in which the support posts are angularly spaced from the base and a second position in which the support posts are adjacent the base.
